## Acoustic Treatment Meets Fine Art

Acoustic Sciences Corporation (ASC) has finally solved the thorny issue of how to fix an acoustically problematic room without making it look ugly. We've perfected a way to print fine art photos and paintings onto a special acoustically transparent fabric. The fabric is then used to cover a panel of acoustically absorptive fiberglass to create the PicturePanel. You get to choose from a vast selection of photos and paintings from our library, or send us a CD of your favorite and we'll print it out.

## Stunningly Beautiful Art

Our PicturePanel photos and paintings have been selected by us and are licensed to us by a huge variety

of talented artists. We also offer 2 panel variations to suit your decor. Basic is 2.25" thick, Enhanced includes vented backing and is 3.75" thick. Choose from 5 frame variations, everything from no frame to elegant hardwood. What you get in every case is the same incredible eye-popping color reproduction.

The PicturePanel is **perfectly suited for offices, conference rooms, restaurants, hotel lobbies, churches, schools, classrooms, and of course, home settings as well.** You get effective yet affordable acoustic enhancement that belongs in every architectural setting, regardless of style.

## The Bottom Line

ASC designed and built the PicturePanel based on customer feedback and simple necessity. Reflected sound (echoes, for lack of a better term), cause problems with today's high powered audio systems. When sound hits the PicturePanel, instead of reflecting, absorption takes place.

We've been building flat panel acoustic products for 20 years, and realized that plain fabric covered panels just don't cut it anymore. Our unique PicturePanel is made in the USA and is only available from ASC.
